## Buoyancy Instability

First, consider a stratified, unmagnetised atmosphere, satisfying

$$\begin{aligned} \frac{dp}{dz} &= -\rho g, \\ p &= \frac{\rho RT}{\tilde{\mu}}, \\ T &= T_0(1-mz) \end{aligned}$$

The linear temperature profile unstable to buoyancy instability that may develop into convection. Assume *no dissipation*. Use simple physical argument for instability conditions.

イロト 不得 トイヨト イヨト 二日

 $\blacktriangleright$  Ideal MHD has adiabatic energy form, so  $p/\rho^{\gamma}$  will be a constant.

Alan Hood St Andrews University

3 March 2010 7 / 38

- ▶ Ideal MHD has adiabatic energy form, so  $p/\rho^{\gamma}$  will be a constant.
- Thus, pressure change inside is related to density change by

$$\delta p = \frac{\gamma p}{\rho} \delta \rho = c_s^2 \delta \rho = dp.$$

- ▶ Ideal MHD has adiabatic energy form, so  $p/\rho^{\gamma}$  will be a constant.
- Thus, pressure change inside is related to density change by

$$\delta p = \frac{\gamma p}{\rho} \delta \rho = c_s^2 \delta \rho = dp$$

$$\delta\rho = \frac{\delta p}{c_s^2} = \frac{dp}{c_s^2} = \frac{dp/dz}{c_s^2}dz = -\frac{\rho g}{c_s^2}dz.$$

Alan Hood St Andrews University

- ▶ Ideal MHD has adiabatic energy form, so  $p/\rho^{\gamma}$  will be a constant.
- Thus, pressure change inside is related to density change by

$$\delta p = \frac{\gamma p}{\rho} \delta \rho = c_s^2 \delta \rho = dp.$$

$$\delta\rho = \frac{\delta p}{c_s^2} = \frac{dp}{c_s^2} = \frac{dp/dz}{c_s^2}dz = -\frac{\rho g}{c_s^2}dz.$$

Instability if

$$\delta \rho < d\rho = \frac{d\rho}{dz} dz,$$

or

$$-\frac{\rho g}{c_s^2} < \frac{d\rho}{dz}.$$

Flux Emergence

Alan Hood St Andrews University

▲ロト ▲圖ト ▲画ト ▲画ト 三直 - のへで

This can be written in a variety of different ways.

► For example, defining *density scale height* H = - \frac{\rho}{d\rho/dz}, buoyancy instability if

$$\frac{1}{H} - \frac{g}{c_s^2} < 0.$$

3 March 2010 8 / 38

This can be written in a variety of different ways.

► For example, defining *density scale height* H = - \frac{\rho}{d\rho/dz}, buoyancy instability if

$$\frac{1}{H} - \frac{g}{c_s^2} < 0.$$

Multiply this by g, gives units of frequency squared. Define the Brünt-Vaïsïla frequency, N, as

$$N^2 = g\left(\frac{1}{H} - \frac{g}{c_s^2}\right),\tag{1}$$

Plasma is unstable to buoyancy if

$$N^2 < 0.$$

Flux Emergence

Alan Hood St Andrews University

3 March 2010 8 / 38

Another equivalent form for the Brünt-Vaïsïla frequency is

$$N^2 = \frac{g}{\gamma} \frac{d}{dz} \left[ \log \left( \frac{p}{\rho^{\gamma}} \right) \right].$$

Instability occurs if the entropy decreases with height.

Alan Hood St Andrews University

3 March 2010 9 / 38

イロト 不得下 イヨト イヨト 二日

Another equivalent form for the Brünt-Vaïsïla frequency is

$$N^2 = \frac{g}{\gamma} \frac{d}{dz} \left[ \log \left( \frac{p}{\rho^{\gamma}} \right) \right].$$

- Instability occurs if the entropy decreases with height.
- Can be rewritten in terms of the temperature gradient and so instability occurs if

$$\frac{dT}{dz} < -\frac{\gamma - 1}{\gamma} \frac{\tilde{\mu}g}{R} = \left(\frac{dT}{dz}\right)_{ad}$$

Remember that the temperature gradient is negative.

Alan Hood St Andrews University

イロト イポト イヨト イヨト

Another equivalent form for the Brünt-Vaïsïla frequency is

$$N^2 = \frac{g}{\gamma} \frac{d}{dz} \left[ \log \left( \frac{p}{\rho^{\gamma}} \right) \right].$$

- Instability occurs if the entropy decreases with height.
- Can be rewritten in terms of the temperature gradient and so instability occurs if

$$\frac{dT}{dz} < -\frac{\gamma - 1}{\gamma} \frac{\tilde{\mu}g}{R} = \left(\frac{dT}{dz}\right)_{ad}$$

Remember that the temperature gradient is negative.

Instability occurs when the temperature gradient (negative) is sufficiently large and exceeds the adiabatic temperature gradient, (dT/dz)<sub>ad</sub>, (entropy of the equilibrium is constant).

Flux Emergence

Alan Hood St Andrews University

$$\delta p = c_s^2 \delta \rho.$$

Alan Hood St Andrews University

3 March 2010 12 / 38

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

$$\delta p = c_s^2 \delta \rho.$$

• Magnetic field evolves with  $B/\rho$  held constant. Hence,

$$\frac{\delta B}{B} = \frac{\delta \rho}{\rho}.$$

Alan Hood St Andrews University

3 March 2010 12 / 38

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへ⊙

$$\delta p = c_s^2 \delta \rho.$$

• Magnetic field evolves with  $B/\rho$  held constant. Hence,

$$\frac{\delta B}{B} = \frac{\delta \rho}{\rho}.$$

 Fluid element expands until in total pressure balance with external plasma.

$$\delta p + \frac{B}{\mu} \delta B = dp + \frac{B}{\mu} dB.$$

Alan Hood St Andrews University

<□▶ <□▶ < □▶ < □▶ < □▶ < □ > ○ < ○

$$\delta p = c_s^2 \delta \rho.$$

• Magnetic field evolves with  $B/\rho$  held constant. Hence,

$$\frac{\delta B}{B} = \frac{\delta \rho}{\rho}.$$

 Fluid element expands until in total pressure balance with external plasma.

$$\delta p + \frac{B}{\mu} \delta B = dp + \frac{B}{\mu} dB$$

Using our expressions for  $\delta p$  and  $\delta B$  in terms of  $\delta \rho$ , we have

$$\left(c_s^2 + c_A^2\right)\delta\rho = dp + \frac{B}{\mu}dB,$$

and for an instability this must be less than  $(c_s^2 + c_A^2)d
ho$ .

Flux Emergence

Alan Hood St Andrews University

3 March 2010 12 / 38

Thus, we have an instability for

$$\frac{dp}{dz} + \frac{B}{\mu}\frac{dB}{dz} < \left(c_s^2 + c_A^2\right)\frac{d\rho}{dz}.$$

Alan Hood St Andrews University

3 March 2010 13 / 38

◆□> ◆圖> ◆臣> ◆臣> □臣

Thus, we have an instability for

$$\frac{dp}{dz} + \frac{B}{\mu}\frac{dB}{dz} < \left(c_s^2 + c_A^2\right)\frac{d\rho}{dz}.$$

This can be rewritten as

$$gc_A^2 \frac{d}{dz} \left[ \log \left( \frac{B}{\rho} \right) \right] + c_s^2 N^2 < 0.$$

Flux Emergence

Alan Hood St Andrews University

3 March 2010 13 / 38

イロト イポト イヨト イヨト 二日

(2)

Thus, we have an instability for

$$\frac{dp}{dz} + \frac{B}{\mu}\frac{dB}{dz} < \left(c_s^2 + c_A^2\right)\frac{d\rho}{dz}.$$

This can be rewritten as

$$gc_A^2 \frac{d}{dz} \left[ \log\left(\frac{B}{\rho}\right) \right] + c_s^2 N^2 < 0.$$

Note that the plasma can be unstable with a magnetic field even when the square of the Brünt-Vaïsïla frequency is positive.

Flux Emergence

Alan Hood St Andrews University

3 March 2010 13 / 38

(2)
#### **Dispersion** Relation

▶ If  $l \to \infty$ , a local dispersion relation can be obtained from the linearised MHD equations.

$$\left[ \left( c_A^4 + 2c_s^2 c_A^2 \right) k^2 + c_A^2 g \frac{d}{dz} \log\left(\frac{B}{\rho}\right) + c_s^2 N^2 \right] \omega^2 + k^2 c_A^2 \left[ k^2 c_s^2 + g \frac{d}{dz} \log B + \frac{c_s^2}{c_A^2} N^2 \right] = 0$$

Alan Hood St Andrews University

3 March 2010 14 / 38

イロト 不得 トイヨト イヨト 二日

.

#### **Dispersion** Relation

▶ If  $l \to \infty$ , a local dispersion relation can be obtained from the linearised MHD equations.

$$(c_s^2 + c_A^2) \omega^4 - \left[ \left( c_A^4 + 2c_s^2 c_A^2 \right) k^2 + c_A^2 g \frac{d}{dz} \log \left( \frac{B}{\rho} \right) + c_s^2 N^2 \right] \omega^2 + k^2 c_A^2 \left[ k^2 c_s^2 + g \frac{d}{dz} \log B + \frac{c_s^2}{c_A^2} N^2 \right] = 0$$

• Instability occurs if  $\omega^2 < 0$ .

• If k = 0, this reduces to the same condition derived in (2).

Flux Emergence

Coronal B uniform,

(日) (同) (日) (日) (日)

No coronal field. Investigate how B gets from convection zone to corona. Flux rope forms but no dynamic ejection.

Coronal B uniform, horizontal,

No coronal field. Investigate how B gets from convection zone to corona. Flux rope forms but no dynamic ejection.

Coronal B uniform, horizontal, vertical,

No coronal field. Investigate how B gets from convection zone to corona. Flux rope forms but no dynamic ejection.

► Coronal **B** uniform, horizontal, vertical, slanted.

# Toroidal loops - eruptions (David MacTaggart)

Figure: Newly formed flux rope.

If overlying field 'removed' then flux rope erupts.

Flux Emergence

Alan Hood St Andrews University

3 March 2010 31 / 38

#### Eruption

Movie showing a toroidal loop emerging and the density ejected into the atmosphere.

(Toroidal.mpg)

### CMEs - Magnetic Breakout

Figure: Middle emergence pushes other fields apart.

Flux Emergence

Alan Hood St Andrews University

3 March 2010 37 / 38
► Cannot easily reproduce exact photospheric magnetic field.

Alan Hood St Andrews University

3 March 2010 38 / 38

- Cannot easily reproduce exact photospheric magnetic field.
- BUT do need guidance form observations.

- Cannot easily reproduce exact photospheric magnetic field.
- BUT do need guidance form observations.
- Initial emergence is North-South for cylindrical loops.

- Cannot easily reproduce exact photospheric magnetic field.
- BUT do need guidance form observations.
- Initial emergence is North-South for cylindrical loops.
- ► Toroidal loop is easier to fully emerge. Rounder sunspots.

- Cannot easily reproduce exact photospheric magnetic field.
- BUT do need guidance form observations.
- Initial emergence is North-South for cylindrical loops.
- ► Toroidal loop is easier to fully emerge. Rounder sunspots.
- BUT cannot get small scale emergence into existing active region.

- Cannot easily reproduce exact photospheric magnetic field.
- BUT do need guidance form observations.
- Initial emergence is North-South for cylindrical loops.
- ► Toroidal loop is easier to fully emerge. Rounder sunspots.
- BUT cannot get small scale emergence into existing active region.
- Emergence associated with shear.

- Cannot easily reproduce exact photospheric magnetic field.
- BUT do need guidance form observations.
- Initial emergence is North-South for cylindrical loops.
- ► Toroidal loop is easier to fully emerge. Rounder sunspots.
- BUT cannot get small scale emergence into existing active region.
- Emergence associated with shear.
- ▶ Quiet Sun and ephemeral regions from a magnetic sheet.
